#### Abstract

The present invention provides a method for altering a T cell mediated pathology in a patient. This method comprises administering a composition comprising two chimeric proteins. Each chimeric protein comprises at least a portion of either the  $V_{\alpha}$  or  $V_{\beta}$  region of a TCR from T cells associated with a T cell mediated pathology isolated from the patient to be treated, and an immunoglobulin constant region. The chimeric proteins are produced by introducing the expression vectors into insect cell lines.
